

Item 8.01 Other events

Agenus Inc. today announced results published from a Phase 2 study demonstrated that more than 90% of the patients treated with Prophage Series G-200 were alive at six months after surgery and 30% were alive at twelve months. Additionally, the median overall survival was approximately eleven months. This compares favorably to the expected median survival for recurrent Glioblastoma multiforme (“GBM”) patients of three to nine months. The primary objective of this multi-center, single arm Phase 2 trial was to assess the survival rate at six months.

The data was published in a manuscript in *Neuro-Oncology*, the official journal of the Society of Neuro-Oncology. GBM is the most common and most aggressive form of primary brain cancer. Despite approved therapy patients with GBM face a poor prognosis. Prophage Series vaccines are currently being studied in both newly diagnosed and recurrent GBM.

The full text of the press release issued in connection with the announcement is being filed as Exhibit 99.1 to this current report on Form 8-K.
